

This is a set of instructions for the bare minimum of information a programmer needs to have a fully functional robot using C++, eclipse, and the SampleRobot class; and for vision with USB cameras, a raspberry Pi, and Python. The code shown is one of many methods, and there is no 'proper' one. The point of robotics is for everyone to find their own solution. You can and should use the programming information taught here to write whatever code and structure you see fit.

Table of Contents:

- Unit 1: C++
  - [Chapter 0: C++ Basics](#)
  - [Chapter 1: Variables and Control Structures](#)
  - [Chapter 2: Loops and Functions](#)
- Unit 2: Robotics Programming
  - [Chapter 3: Classes and The Robot Class](#)
  - [Chapter 4: WPILib Classes](#)
    - Where and how to program:
      - Motor Controllers
      - Joysticks/Controllers
      - Pneumatics
      - Sensors
    - [Chapter 5: Building a Tele-Op](#)
- Unit 3: Autonomous Programming and Advanced Control
  - Chapter 6: [Using the Dashboard](#)
  - Chapter 7: Using Sensor Values
    - PID
    - Using Vision Readings
  - Chapter 8: Building an Autonomous
- Unit 4: Vision Processing
  - Chapter 9: Methods and parts for Vision
  - Chapter 10: GRIP and OpenCV
  - Chapter 11: Using OpenCV with Raspberry Pi
- Appendix
  - [Electrical Parts](#)

Any chapters or sections not yet published will be released over build season 2018
